Problem & motivation

Problem:

Professionals spend a significant amount of time managing emails, scheduling meetings and coordinating availability.

Solution:

The solution is an AI-powered Personal Executive Assistant.

The assistant reads incoming emails, understands the user's intent — such as meeting requests — checks calendar availability, proposes suitable time slots, and replies either autonomously or with human approval.

Technical approach

- LLM-based agent: Llama, 8a GPT-based model
- Tool use: Gmail API, Google Calendar API
- Memory: Supabase
- Orchestration: LangChain
- Voice layer (Optional): Whisper + TTS

System diagram

Sprint plan

Sprint 1: Email ingestion + intent recognition

Sprint 2: Informations extraction + Availability checking

Sprint 3: simple slot generation + Preferences

Sprint 4: Sending responses + Voice integration (Optional)

Open risks

- Data privacy and email security concerns
- Incorrect and inappropriate automatic replies
- API limitations (rate limits, permissions)
- Ambiguity in user intent interpretation
